

BoostBySmith GEN1/2 Hayabusa Ignition Delete Harness

Installation Manual

If you purchased the relay version that uses the bikes red kill switch as main power, shut this switch off first (stop position).

Remove left fairing and inner panel, locate Right Hand Control Connector (10 pin black connector for 99-07, 8 pin black connector for 08-12, and 8 pin grey connector for 13-20) and green 6 pin connector (ignition switch connector), and headlight connector (white/clear 6 pin connector for 99-07 only). Disconnect them (unless you purchased the toggle switch version and then just disconnect the 6 pin connector). Install the inline adapters that I provided on the harness to both the ignition key, right hand control connectors, and headlight harness (99-07 only). Once connected, flip the red kill switch to the center position, the bike should behave the same as turning the ignition key on, and be ready to start (dash on, fuel pump priming if in neutral etc).
